Title : Results obtained in the operation of a high pressure
continuously operating coil boiler unit with liquid
slag removal

Periodical : Teploenergetika, 2, 26-31, F 1955

Abstract : Outlined are results of work in operation and testing of
a unit consisting of a continuously operating high pressure
coil boiler with liquid slag removal of the 67-1-SP-
230/100 type built by the Bureau for Construction of
Continuously Operating Coil Boilers of the Podol'skiy
Machine-Building Works im. Ordzhonikidze. This boiler is
heated with pulverized Donets coal. Diagrams, charts.

Title : The firing of once-through boilers

Periodical : Elek. sta., 3, 1-6, Mr 1955

Abstract : The authors emphasize the quick-starting and stopping characteristic of the once-through boilers of the forced-flow type. The ignition is relatively simple, but is necessary to watch closely the stability of evaporation. This condition is provided for in serial high-pressure boilers of the 67-SP-230/100 type. The initial pressure should be at least 25 to 30 atm. 6 diagrams

TITLE: Behavior of an ohmic contact in strong electric fields in the presence of a cross magnetic field [Report at the All-Union Conference on Semiconductor Devices, Tashkent, 2-7 October, 1961]

SOURCE: Elektronno-dy*rochny*ye perekhody* v poluprovodnikakh. Tashkent, Izd-vo AN UzSSR, 1962, 61-65

TOPIC TAGS: semiconductor-metal ohmic contact

ABSTRACT: Experiments with a semiconductor-metal contact placed in a magnetic field and passing square pulses are reported. Germanium samples 1-1.5-cm thick, 3-5 sq mm cross-section, with a resistivity of 20-40 ohms-cm were equipped with tin contacts. Voltages up to 100 v were applied as square pulses of 10-100-microsec duration with a repetition rate of 1 cps to 10 kc. At voltages up to 20 v, the pulses retained their square shape. At higher voltages, leading and trailing pulse edges differed widely; an explanation is offered in terms of nonequilibrium carriers. Current-voltage characteristics plotted for the leading pulse edge are linear; those for the trailing pulse edge, exponential. Further experiments involved cross magnetic field up to 1,400 oerst. The magnetic field caused a
Card 1/2

I 17044-63

ACCESSION NR: AT3002981

decrease in the current-pulse trailing edge and did not affect the leading edge. The phenomenon is explained by deviation of carriers by the magnetic field which varies the interelectrode distance. Orig. art. has: 5 figures and 6 formulas.

AUTHOR: Lunezky, S. P.TITLE: Choice of input circuit in the measurement of small Tau by the phase method

CITED SOURCE: Dokl. AN UzSSR, no. 11, 1964, 27-30

TOPIC TAGS: lifetime measurement, input circuit, phase method, parasitic capacitance

TRANSLATION: A calculation is made of the input circuit used in the phase method of measuring small lifetimes τ , taking into account the influence of not only parallel but also series capacitances, the role of which increases at high frequencies. The presence of series capacitance produces a parasitic phase shift, which cannot be separated as a term and compensated for beforehand; this parasitic shift can reverse the sign of the measured quantity, and this can be erroneously interpreted as being due to "inductive" physical processes. An analysis of the obtained formulas and experimental data shows that the measurement of τ is best carried out in the voltage-generator mode. If such a mode cannot be produced,

Card 1/2

L 59004-65

ACCESSION NR: AR5015988

then to eliminate the influence of the parasitic capacitance it is recommended that a shunting resistance resulting in a diode operating mode be introduced.

TITLE: Phase-compensation method of ^{pm}measuring relaxation times on ^Bthe order of 0.1 nanosecond in p-n junctions

SOURCE: AN SSSR. Doklady, v. 159, no. 3, 1964, 532-535

TOPIC TAGS: phase measurement, relaxation time, bridge measurement, pn junction, nanosecond pulse

ABSTRACT: A new bridge method combining the advantages of phase and null measuring methods is described. The method makes possible the measurement of relaxation times of the order of 10^{-10} sec. Specifically, the method allows separate determination of resistivity and capacitance of the diode arm by using a comparison bridge circuit and a phase meter as the null detector along with voltmeters to establish the voltage balance. Under the assumption of an equality of parasitic capacitances of both standard resistive arms as well as the same equality between the diode and the comparator arm, the

Card 1/2

L 21416-65
ACCESSION NR: AP4049915

phase balance of the bridge is attained when both the resistor and the capacitor of the comparator arm equal the corresponding parameters of the diode. The system has a special input circuit which makes possible stabilization of the diode prior to measurements and reduction to minimum of parasitic capacitances of standard arms. The measurement accuracy, as tested by replacement of the diode by corresponding resistance and capacitance standards, was found to be in a fair agreement with the standards within the relaxation time range of 10^{-8} to 10^{-10} sec. The range can be extended easily by an order up and down by appropriate manipulation of circuit details. The relative error in a series of repeated measurements did not exceed 10 percent.

TITLE: Using frequency-phase characteristics of impedance in the p-n junction for measuring short lifetimes

CITED SOURCE: Dokl. AN UzSSR, no. 10, 1964, 11-14

TOPIC TAGS: semiconductor diode, carrier lifetime, semiconductor research

TRANSLATION: A theoretical basis and experimental proof is given for the possibility of using the phase shift between the voltage across a diode and the current through it to measure short lifetimes in semiconductors. In contrast to previously developed methods, this method does not require establishment of limiting operating conditions for the diode (conditions for the current or voltage generator). The method facilitates the measurement of lifetimes less than 10^{-9} sec. An experimental check of the method is made on an electrical analog of a diode. A. Stepanova

ORG: Physico-Technical Institute, AN UzSSR (Fiziko-tehnicheskii institut AN UzSSR)

TITLE: Phasometric device for the determination of effective cross sections for local centers in a doped photoconductor

SOURCE: AN UzSSR. Izv. Ser fiz-matem n, no. 2, 1966, 41-46

TOPIC TAGS: photoconductor, infrared quantum generator, relaxation process, phase shift analysis, *CURRENT CARRIER, CAPTURE CROSS SECTION*

ABSTRACT: An experimental setup for determining the relaxation time τ for the capture of current carriers in a doped photoconductive semiconductor is described. This characteristic time can be used to determine the effective capture cross section for current carriers by local doping centers in the semiconductor. The measurement of τ is accomplished by means of phase locked detection of the signal from the sample, the illumination of which is interrupted by a chopper. The essential purpose of the article is to describe in detail a method and a practical experimental arrangement for the determination of τ using a phase locked detection system. Spurious phase shift is eliminated by a calibration in which the infrared source and the semiconductor are replaced by a lamp and photomultiplier, respectively. An uncalibrated phase shift ampli-

Card 1/2

L 46712-66

ACC NR: AP6023027

fier is adjusted so that the output of the system is nulled. The lamp and photomultiplier are then replaced by the infrared source and photoconductor. A calibrated phase shift amplifier is then used to null the signal again, giving a measurement of the phase shift in the photoconductor. The equipment described will measure relaxation times in the range 10^{-3} to 10^{-6} seconds. Hence for materials with a carrier concentration of 10^{12} cm^{-3} an effective capture cross section of 10^{-16} to 10^{-13} cm^2 can be measured. Orig. art. has: 4 figures, 6 formulas.

Temperature regulation of the denervated limb

Tables I Illus. I

Paragraph 2558 Hungarica Acta Physiologica, Budapest 1949, 2/1-4 (93-102) Graphs 4
A special method was used for the determination of blood flow where the velocity of the blood inflow from the femoral vein into a cylindrical vessel was recorded by means of a hot-wire anemometer. The difference between the oxygen load of arterial and venous blood was determined with Havemann's photocolormeter. The method did not disturb physiological conditions, as blood losses could be avoided. The observations were continued for several hours. After dissection of the spinal cord the dog's hind leg reacted to general refrigeration with an increase of the metabolic rate by 50 %, but the denervated limb of such animals also reacted with an increase in a similar range. This remaining temperature regulation could easily be abolished by narcotics. It was therefore supposed that this residual regulation was mediated by excitation of the temperature-regulating centre, which stimulated, in an unknown way, the humoral chemical regulation of heat.

Abstract : Administering estradiolic benzoate (in doses of 10,000 m
units for 20 days) to female dogs inhibited the contrac-
tions of the gall bladder and produced a complex reflecto-
ry activity phase of a food stimulant (milk). It did not,
however, affect gall bladder contractions by producing a
neurochemical phase or spontane contractions.

AUTHOR: Lungu, Anton, Engineer

TITLE: The radioactive equilibrium of uranium deposits

PERIODICAL: Revista Minelor, v. 11, no. 9, 1960, 404 - 411

TEXT: One of the multiple factors which influences the results of the radiometric measurements of uranium deposits is the radioactive equilibrium; in the present case between the elements which form the U - Ra natural series. The radiometric measurements are based on the natural radioactivity characterized by alpha and beta emission and gamma radiation. Uranium, the generating nucleus, is finally transformed into stable plumbum after having passed through a series of intermediate phases. Analyzing the U-Ra series, one finds that the uranium itself is less radioactive than the elements generated during the disintegration process. This situation appears more evident after having analyzed the power spectrum of the U-Ra series, taking into consideration the lower power limit of the installation used. The lower power limit at the recording of the beta particles or gamma radiation depends on the type of G-M counter used. Since the author has used an "MC"-type G-M counter, provided with a Fe or Al casing, 1 - 3 mm

Card 1/7

The radioactive equilibrium of uranium deposits

thick, the power limit regarding the radiometric measurement was between 0.9 and 1.0 Mev. Beta emitting elements were UX_2 with $E_{max} = 2.32$ Mev; Ra C with $E_{max} = 3.17$ Mev; Ra C' with $E_{max} = 1.80$ Mev; and Ra E with $E_{max} = 1.17$ Mev; and gamma radiating elements: Ra C with $E_{max} = 1.766$ Mev, and Ra C' with $E_{max} = 2.090$ Mev. The establishment of the equilibrium between two radioactive elements is connected to the knowledge of the kinetics of the disintegration and the accumulation of the nuclei of the respective atoms. Notating with N_1 and N_2 the number of the generating and resulting nuclei, the accumulation speed in t time of the resulting nucleus will be equal to the difference of the disintegrating speed of the generating and resulting nuclei. If the generator nucleus has a shorter life than the resulting nucleus ($\lambda_1 < \lambda_2$), one obtains the radioactive equilibrium. The $\frac{N_1}{N_2}$ ratio and the ratio of the disintegrating speeds will be constant. The Ra/U²³² radioactive equilibrium is established after a fairly short period. In many deposits, however, the Ra/U equilibrium is disturbed. The knowledge of the variation of the Ra/C ratio is very important for radiometric operations performed at these deposits. The equilibrium study is accomplished in deviation percentages against the value $3.4 \cdot 10^{-7}$ taken as 100%. The equilibrium is thus expressed by: $\xi = \frac{\alpha \cdot 100}{3.4 \cdot 10^{-7}}$, (7). Supposing the existence of a propor-

Card 2/7

The radioactive equilibrium of uranium deposits

R/010/60/011/009/001/001
A231/A126

tionality between the radiation intensity and the content of the radioactive elements, one can admit the relation $I = KC$ (8), in which I = intensity of the measured radiation, C = content of the respective element, and K = proportionality coefficient. According to the distribution of the radioactive equilibrium in the deposit, there are 2 cases distinguished: 1) Equilibrium disturbance of local character producing errors in radiometric operations. An example is given by the Happy Jack deposit in the USA (Fig. 4); 2) Equilibrium disturbance of regional character, producing systematic errors at the radiometric measurements which can be avoided if it is possible to establish the Ra/U value by another way. The author then analyzes the local equilibrium disturbance at a "post-shaped" deposit, more than 100 m long, the thickness varying from 1 to several tens of meter, having an inclination of 80° . The deposit has been explored in 6 horizons: A, B, C, D, E and F (Fig. 5 and 6). The distance between the horizons is 25 m, with the exception of E - F, where it is 50 m. On the basis of a complex study the author has established the horizontal and vertical distribution of the equilibrium. The quantitative interpretation of the results of radiometric measurements is very complicated, so that the quantitative relations are experimentally established by introducing a series of coefficients. In case the exploitation of the deposit is accomplished by drilling holes, a series of experi-

Card 3/ 7

The radioactive equilibrium of uranium deposits

R/010/60/011/009/001/001
A231/A126

mental works are being performed to establish the transformation coefficient. On the basis of $I = KC$, (8) and the sum of intensities produced by a sum of active layers, one obtains the surface relation given by Professor Kazanskiy: $S = KCh$, where from $C = \frac{S}{Kh} 100\%$, (10). [Abstracter's Note: the author gives this equation the number 9, but this number has been used already for the previous relation, so that the abstracter took the next number, i.e. 10 for the latter equation]. The transformation coefficient K affects: 1) the thickness of the mineral zone, and 2) the real metal content in the ore. Finally, K is the element which establishes the metal content. On the basis of the experimental data, the author has constructed the function $K = f(\xi)$. The zonal distribution of the radioactive equilibrium makes the use of different transformation coefficients impossible. For a rational interpretation of the material obtained by different gamma operations, at least the orientative knowledge of the radioactive displacement is necessary. In case of a compensated zonal distribution, the use of coefficients, in case of $\xi = 100$, will supply only small errors. In case of a non-compensated zonal distribution; the value of ξ should be known and the value of the content obtained by a normal coefficient (in case of equilibrium) will be correctible. The establishment of economic reserves in case of hidden deposits is accomplished on the base of radiometric measurements and the correct interpreta-

Card 4/7

The radioactive equilibrium of uranium deposits

R/010/60/011/009/001/001
A231/A126

tion of the material will lead to essential conclusions for the respective deposit. The knowledge of the equilibrium is of great importance for the exploitation process and radiometric prospecting. Because of the frequent displacement ($\epsilon < 100$), the radiometric prospecting methods are connected with geochemical methods. The radioactive equilibrium is one of the factor complexes which affects the quantitative relation. The present work has not completely exploited this factor. There are 12 figures and 12 references: 8 Soviet-bloc and 4 non-Soviet-bloc. The references to the English-language publications read as follows: Ref. 7: G. Friedländer and J. Kennedy.: Introduction to radiochemistry. (Editia în limba rusă 1952), Moscova. Ref. 8: K. Rankama: Isotope Geology (în limba rusă, Moscova 1956). Ref. 10: H. Orig Pub : Bul. stiint. Acad. RFR. Sec. med., 1956, 8, No 3, 799-827.

Abstract : Five hundred patients were examined. The metabolism test during physical strain (according to the method of Durupt) is more conclusive than the basic metabolism test. This method makes it possible to differentiate between hyperthyroidism and a neurotic syndrome of pseudothyroidism, and to diagnose metabolism disturbances in diseases of the hypophysis and the suprarenal gland. -- From the author's summary.

the Mechanism by Which Hypertensive Disease is Produced
(A Study of 6040 Workers in Various Fields.)

Orig Pub : Commun. Acad. RPR, 1957, 7, No 2, 261-265

Abstract : A considerable number of individuals with increased arterial pressure were brought to light during the course of the investigation. In the first stage of hypertensive disease the single and fundamental symptom in many cases is an increase in arterial pressure. Mental work is an etiological factor in hypertensive disease more often than physical work; heavy physical work is more rarely an etiological factor than light physical work.

Title : The Acheivements of Agronomical Science in the Rumanian
People's Republic.

Orig Pub : Kolkhoznoye Proizvodstvo, 1956, No 7, 44-45

Abst : A brief listing is given of some of the acheivements of
scientific research institutes and experimental stations
of the Rumanian Peoples's Republic in increasing yields
of major crops. In particular, new techniques of plo-
wing and fertilization are described. Considerable ef-
fort has been devoted to the vernalization of various
seed crops and to the introduction of new varieties of
cotton, tomatoes and melons. Effective techniques for
fighting pests have been perfected. Studies have been

Title : On the Study of the Biology of Bacillus Anthracis in Soil.

Orig Pub : Anuarul lucrar.,. stiint. Inst. agron., 1957, 447-455.

Abstract : The possibility is shown of the preparation of B. anthracis in soil under certain conditions of temperature, humidity and presence of organic substances (especially of blood). In dry soil, the bacilli and their spores perish.
